I have more than 10 webservers with Windows Service. I want to manage these servers with runbook. It works OK as long as you dont start the service from VBS (Batch Script). But I want to monitor and manage these servers via Windows Service. Do you know any solution for that? I need to disable a specific account in an SharePoint environment that has multiple Active Directory domains. If I don't specify the domain it asks which one, if I type in the domain name it doesn't work, I also tried to open the access denied dialog but it doesn't show any entry. I have a sharepoint 2010 environment and i want to move to 2013 one. I have set up a sharepoint 2013 env. but when trying to connect to the 2010 environment via java application, I am getting an error. Below is the stack error Connection refused java.net.ConnectException: Connection refused: connect at java.net.DualStackPlainSocketImpl.connect0(Native Method) at java.net.DualStackPlainSocketImpl.socketConnect(Unknown Source) at
